P10: CSV DATASET INSIGHT & TASK RECOMMENDER

Continuous Assessment Mini Project | Subject: Generative AI (2026-2027)

Student Name:	Atharva Shelar	**Academic Subject:**	Generative AI
Roll Number:	10	**Practical Problem:**	P10
Class / Batch:	AIA-3 [LY]	**Submission Date:**	November 2026
GitHub Repo:	https://github.com/atharva-shelar/csv-dataset-insight-p10	**Live App URL:**	https://huggingface.co/spaces/atharva-shelar/csv-dataset-insight-p10

2. Official Problem Statement & Objectives

Goal: Profile any uploaded CSV and recommend the right ML task and next steps.
Five Mandatory Core Tasks:
• **U1:** Plot column distributions; recommend learning type and 10-stage lifecycle steps.
• **U2:** Have the LLM write and run Pandas code through strict AST validation, then explain the output in plain English.
• **U3:** Group similar columns with Sentence-BERT embeddings; let a vision LLM read and interpret distribution charts.
• **U4:** Generate synthetic tabular rows with PyTorch CTGAN; compare real vs. synthetic distributions via Kolmogorov-Smirnov metrics.
• **U5:** Flag sensitive PII columns, target class imbalance, and evaluate bias/hallucination test benchmarks.

3. Tools, Models and Datasets

• **Programming & Framework:** Python 3.12, Streamlit v1.67+, Pandas, NumPy, SciPy, Plotly, Matplotlib, ReportLab.
• **Generative AI Models:** Google Gemini 2.5 Flash (Core LLM & Multimodal Vision), Sentence-BERT (all-MiniLM-L6-v2 for 384-d column embeddings), PyTorch CTGAN (Tabular Synthesis), GPT-2 (Autoregressive Baseline).
• **Public Benchmark Datasets Tested:**
1. *Iris Flower Dataset* (150 rows, 5 features, Multiclass Classification)
2. *Titanic Survival Dataset* (891 rows, 12 features, Binary Imbalanced Classification)
3. *Wine Quality Red Dataset* (1,599 rows, 12 features, Continuous Regression)

4. Approach & System Architecture

The application architecture decouples user interface from analytical and generative engines. Uploaded data undergoes delimiter sniffing and encoding detection, followed by deterministic data health profiling. The system enforces a multi-tiered security perimeter: LLM-generated Pandas code is intercepted by an AST syntax visitor that approves only safe DataFrame operations before running inside an isolated namespace with strict 5-second timeouts. Embeddings are computed bidirectionally using Sentence-BERT to generate cosine similarity clusters, while distribution plots are converted to in-memory PNG buffers for Gemini Multimodal Vision analysis.

Module	Underlying Mechanism	Security / Safety Layer
U1 Profiling & ML Recommender	Deterministic IQR outlier detection & task heuristics	Formula-grounded health scoring (0–100)
U2 LLM Data Assistant	Gemini 2.5 Flash + Few-Shot Prompting	AST allowlist; blocks imports, files & eval
U3 Column Intelligence & Vision	Sentence-BERT (384-d) + Gemini Vision	In-memory pixel streaming; no raw data leak
U4 CTGAN Synthetic Lab	Conditional GAN + Gaussian Mixture Models	Sub-minute CPU epoch caps; KS validation
U5 Responsible AI Guardrails	PII regex scanner & class imbalance audits	Accuracy paradox warnings; 100% attack blocking

5. Key Code Highlights & GitHub Repository

Public GitHub Repository: https://github.com/atharva-shelar/csv-dataset-insight-p10
Core AST Code Validator Snippet:

```
class SecurityVisitor(ast.NodeVisitor):
    def visit_Import(self, node):
        self.violations.append(f'Import statement forbidden: {node.names}')
    def visit_Call(self, node):
        if isinstance(node.func, ast.Name) and node.func.id not in ALLOWED_FUNCTIONS:
            self.violations.append(f'Unapproved call: {node.func.id}()')
# Validates AST syntax tree before isolated namespace execution
```

6. Captioned System Outputs & Generative Assets

• **Figure 1: Executive KPI Dashboard & Quality Score** – Displays real-time record counts, missingness breakdowns, and the deterministic Data Quality Score formula.
• **Figure 2: Visual Analytics & Correlation Heatmap** – Interactive Plotly histograms with marginal box plots and Pearson correlation matrix.
• **Figure 3: AI Data Assistant (Module U2)** – Natural language query translated into executable Pandas code, approved by AST visitor, and explained in plain English.
• **Figure 4: Sentence-BERT Cosine Similarity Matrix (Module U3)** – Dense 384-dimensional semantic clustering grouping related attributes.
• **Figure 5: Real vs. Synthetic Distribution Overlay (Module U4)** – Empirical continuous distribution comparisons with Kolmogorov-Smirnov test statistics.
• **Figure 6: Responsible AI PII & Class Imbalance Audit (Module U5)** – Detection of personal identifiers and evaluation of majority-to-minority distribution skewness.

7. Empirical Results Across Three Public Datasets

Evaluation Metric	Iris Flower	Titanic Survival	Wine Quality Red
Dataset Shape	150 rows × 5 cols	891 rows × 12 cols	1,599 rows × 12 cols
Missing Value Cells	0 (0.0%)	177 (8.1%)	0 (0.0%)
Duplicate Records	1 row (0.67%)	0 rows (0.0%)	240 rows (15.01%)
Data Quality Score	**99.0 / 100**	**90.5 / 100**	**83.4 / 100**
Recommended ML Task	Multiclass Classif.	Binary Classif.	Regression / Ranking
S-BERT Semantic Pairs	10 pairs (≥0.60)	66 pairs (≥0.60)	66 pairs (≥0.60)
CTGAN Mean KS Stat	**0.362**	**0.281**	**0.276**
Correlation Delta (MAE)	0.509	0.040	0.215
Flagged PII Columns	0 (Clean)	2 (Name, Sex)	0 (Clean)
Target Imbalance Ratio	1.0:1 (Balanced)	1.61:1 (Mild)	68.1:1 (Severe)
Hallucination Accuracy	**100.0%**	**100.0%**	**100.0%**

8. Technical Limitations & Documented Failure Cases

1. Adversarial Shell Injection: Prompts instructing the assistant to run import os or delete files are stopped by the AST visitor with a security violation exception.
2. Rare Category Probability Distortion: In highly imbalanced categorical features, CTGAN generators trained on small CPU batches can slightly distort low-frequency categories.
3. Vision Model Resolution Limits: Gemini Vision reliably identifies global distribution curvature (e.g. right-skewness) but approximates exact numerical percentiles compared to DataFrame computations.

9. Ethical Note & Responsible AI Statement

Synthetic data generated via CTGAN provides structural utility for development but does not constitute formal differential privacy (ϵ, δ). User personal data is strictly protected: prompts send schema metadata with PII masked, and code execution is restricted to read-only sandboxes. All model architectures and reference datasets comply with open licenses (MIT, Apache 2.0, CC-BY 4.0).

10. Conclusion

DataPulse AI successfully demonstrates an end-to-end, responsible Generative AI platform for tabular dataset intelligence. By fusing deterministic heuristics with Google Gemini 2.5 Flash, Sentence-BERT semantic embeddings, and PyTorch CTGAN tabular synthesis, the application satisfies all five practical tasks (U1–U5) and syllabus layers without fabricated metrics. The system provides rigorous AST security sandboxing, empirical statistical validation, and an intuitive Streamlit interface for academic evaluation.
